

# Custom Font Demo

This document is rendered with a caller-supplied font (Source Serif 4) instead of the bundled Source Sans 3 default, via `FontRegistry::with_fonts()` and `Document::render_with_fonts()` — no default-fonts feature required.

Any static TrueType font with glyf outlines works here (see `FontData::load` / ADR-012 for the exact constraints) — variable fonts and CFF/OTF fonts are rejected.

This line uses `.italic()` — `FontKey::SANS_ITALIC` was registered above, so this renders instead of failing with `RenderError::MissingFont`.

Sample document — demonstrates the API, not a real document.
