2 Objective	3
3 Architecture	3
3.1 Control Layer	3
3.2 Device Layer	4
4 Implementation Plan	4

1 Background

The sample residence currently runs separate point solutions for lighting, heating and access control that don't talk to each other. Each component is controlled through its own app (demo text).

2 Objective

A central, locally hosted control layer should make every device addressable through one unified protocol — no cloud dependency, and it must keep working offline (demo text).

3 Architecture

3.1 Control Layer

A local hub owns automation rules and state management; devices are reached through an open, vendor-neutral protocol (demo text).

Key Takeaway

Without a local control layer, every extension stays an isolated solution. No expansion before the protocol is settled.

3.2 Device Layer

Existing devices are brought in gradually through bridge modules; new purchases follow the chosen protocol standard exclusively (demo text).

4 Implementation Plan

1. Hub selection and test setup (demo)
2. Migrate lighting control (demo)
3. Migrate heating and access control (demo)
4. Define and test automation rules (demo)
